1 The axioms of time evolution

Let us consider the axioms of quantum mechanical time evolution:

- 1. States are described by kets at some starting time t_0 : $|\alpha\rangle = |\alpha, t_0\rangle$;
- 2. their time evolution is described by a linear operator $U(t;t_0)$ as $|\alpha,t_0;t\rangle = U(t,t_0)|\alpha\rangle$;
- 3. this time evolution obeys $\lim_{t\to t_0} |\alpha, t; t_0\rangle = |\alpha; t_0\rangle$.

If we have an observable A, we can express our states with respect to its eigenbasis $|\alpha'\rangle$:

$$|\alpha, t_0\rangle = \sum_{\alpha'} c_{\alpha'}(t_0) |\alpha'\rangle$$
, (1)

and do the same for their evolved counterparts, with evolved coefficients $c_{\alpha'}(t)$. If [A,H]=0 then $|c_{\alpha'}(t)|=|c_{\alpha'}(t_0)|$, while in general this does not hold.

We impose the normalization of kets: $1 = \langle \alpha | \alpha \rangle = \sum_{\alpha'} |c_{\alpha'}(t)|^2$ for all times. This directly implies that the linear operator U must be unitary: $U^{\dagger}U = \mathbb{1}$.

Also, we impose the composition law: if $t_2 \ge t_1 \ge t_0$, then $U(t_2;t_0) \stackrel{!}{=} U(t_2;t_1)U(t_1;t_0)$.

Condition 3 means that we can expand:

$$U(t_0 + \mathrm{d}t, t_0) = 1 + \frac{H\,\mathrm{d}t}{i\hbar} \tag{2}$$

with some self-adjoint operator H. Manipulating this, for a generic time t we get:

$$\frac{\mathrm{d}}{\mathrm{d}t}U(t;t_0) = \frac{HU}{i\hbar}\,,\tag{3}$$

which directly implies the Schrödinger equation

$$i\hbar\partial_t |\alpha, t_0; t\rangle = H |\alpha, t_0; t\rangle$$
 (4)

1.1 Time-independent Hamiltonians

In the previous lessons we introduced the Dirac representation, where we defined:

$$|\alpha t_0 t\rangle = U(t - t_0) |\alpha t_0\rangle \tag{5a}$$

$$=e^{-\frac{iH(t-t_0)}{\hbar}}\left|\alpha\right\rangle \tag{5b}$$

$$=\sum_{a'}e^{-\frac{iE_{a'}(t-t_0)}{\hbar}}\left|a'\right\rangle\left\langle a'\right|at_0\right\rangle \tag{5c}$$

$$=\sum c_a'(t_0)e^{-\frac{iE_{a'}(t-t_0)}{\hbar}}\left|a'\right\rangle \tag{5d}$$

$$=\sum c_a'(t)\left|a'\right\rangle \tag{5e}$$

and

$$\left\langle \bar{x'} \middle| a't_0 t \right\rangle = \sum_{\alpha} c'_{\alpha}(t_0) e^{-\frac{iE_{\alpha'}(t-t_0)}{\hbar}} \left\langle \bar{x'} \middle| a' \right\rangle, \tag{6}$$

such that $\psi(\bar{x'},t)=\sum c'_a(t_0)e^{-\frac{iE_{a'}(t-t_0)}{\hbar}}u_{a'}(\bar{x'})$. Than from Dirac completeness relation,

$$c_{a'}(t_0) = \left\langle a' \middle| \alpha t_0 \right\rangle = \int d^3 x' \left\langle a' \middle| \bar{x'} \right\rangle \left\langle \bar{x'} \middle| \alpha t_0 \right\rangle, \tag{7}$$

and for this reason

$$\left\langle x'' \middle| \alpha t_0 t \right\rangle = \sum_{n} e^{-\frac{iE_{a'}(t-t_0)}{\hbar}} \left\langle x'' \middle| a' \right\rangle \int_{n} d^3 x' \left\langle a' \middle| x' \right\rangle \left\langle x' \middle| a t_0 \right\rangle \tag{8a}$$

$$= \int d^3x' \sum \left\langle x'' \middle| a' \right\rangle \left\langle a' \middle| x' \right\rangle e^{-\frac{iE_{a'}(t-t_0)}{\hbar}} \left\langle x' \middle| at_0 \right\rangle \tag{8b}$$

$$= \int d^3x' K \left\langle x' \middle| at_0 \right\rangle \tag{8c}$$

where we defined the propagator K. We write otherwise $\psi(x'',t) = \int d^3x' K(x'',t,x',t_0) \psi(x',t_0)$, such that the propagator satisfies:

- *K* respects Schrodinger equation, since $i\hbar \langle x' | \alpha t_0 t \rangle = \langle x' | H | \alpha t_0 t \rangle$ and $\langle x' | a' t_0 t \rangle = e^{-\frac{iE_{a'}(t-t_0)}{\hbar}} \langle x'' | a' \rangle$
- $\lim_{t\to t_0} K = \delta^3(x''-x')$, i.e. the evolution of a particle which was in x' at t=0

1.2 Free particle propagator

Now we want to obtain the propagator *K* aforementioned for the particular case of a free particle hamiltonian. In the space of momenta we have

$$P\left|p'\right\rangle = p'\left|p'\right\rangle, \left\langle x'\right|p'\right\rangle = \frac{e^{\frac{ip'x'}{\hbar}}}{\sqrt{2\pi\hbar}}, \qquad H\left|p'\right\rangle = \frac{p'^2}{2m}\left|p'\right\rangle.$$
 (9)

In this case we have

$$K = \int dp' \left\langle x'' \middle| p' \right\rangle \left\langle p' \middle| x' \right\rangle e^{-\frac{ip^2(t-t_0)}{\hbar 2m}} = \int_{-\infty}^{+\infty} dp' \frac{e^{\frac{i}{\hbar} \left(p'(x''-x') - \frac{p'^2}{2m}(t-t_0) \right)}}{2\pi\hbar}$$
 (10)

Considering that

$$\frac{i}{\hbar} \left(p'(x'' - x') - \frac{p'^2}{2m} (t - t_0) \right) = -\frac{i(t - t_0)}{2m\hbar} \left(p'^2 - \frac{2mp'(x'' - x')}{t - t_0} \right) = -\frac{i(t - t_0)}{2m\hbar} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_0)}{t - t_0} \left(p' - \frac{m(x'' - x')}{t - t_0} \right)^2 + \frac{i(t - t_$$

Now, defining the new variable $\xi = p' - \frac{m(x''-x')}{t-t_0}$, we finally obtain

$$K = \frac{e^{\frac{im(x''-x')^2}{2m\hbar}}}{2\pi\hbar} \int_{-\infty}^{+\infty} d\xi e^{-\frac{i(t-t_0)\xi^2}{2m\hbar}} = \frac{e^{\frac{im(x''-x')^2}{2m\hbar}}}{2\pi\hbar} \sqrt{\frac{2m\pi\hbar}{i(t-t_0)}}$$
(12)

1.3 Harmonic oscillator

In the same way we studied the free particle problem, we want to obtain the propagator for the harmonic oscillator, i.e. a single particle system under the evolution with the hamiltonian

$$H = \frac{p^2}{2m} + \frac{m\omega^2 x^2}{2},\tag{13}$$

where we know that defining the operator distruction $a=\sqrt{\frac{m\omega}{2\hbar}}\left(x+\frac{ip}{m\omega}\right)$, we obtain an explicit writing for the eigenvalues $E_N=\hbar\omega(N+\frac{1}{2})$ and the eigenfunctions respect the relations $|n+1\rangle=\frac{a^+}{\sqrt{n+1}|n\rangle}$, in such a way that

$$\left\langle x' \middle| a \middle| 0 \right\rangle = \sqrt{\frac{m\omega}{2\hbar}} \left\langle x' \middle| \left(x + \frac{ip}{m\omega} \right) \middle| 0 \right\rangle.$$
 (14)

It follows that $\left(x'+\frac{i}{m\omega}(-i\hbar\frac{d}{dx'})\right)\langle x'|0\rangle$ and, defining $x_0=\sqrt{\frac{\hbar}{m\omega}}$, we have $\langle x'|0\rangle=\eta e^{-\frac{x'^2}{2x_0^2}}$ with $\eta=\frac{1}{(x_0\pi)^{\frac{1}{4}}}$. In this case we obtain

$$\left\langle x' \middle| n \right\rangle = \frac{1}{\pi^{\frac{1}{4}} \sqrt{2^n n}} \frac{\left(x' - x_0^2 \frac{d}{dx'} \right)^n}{x_0^{n + \frac{1}{2}}} e^{-\frac{x'^2}{2x_0^2}} = \frac{1}{\pi^{\frac{1}{4}} \sqrt{2^n n!}} H_n(y) e^{-\frac{x'^2}{2x_0^2}}, \tag{15}$$

where we defined $y = \frac{x'}{x_0}$, and the propagator

$$K = \sum_{n=0}^{\infty} \left\langle x' \middle| n \right\rangle \left\langle n \middle| x'' \right\rangle e^{-i\omega(n+\frac{1}{2})(t-t_0)} = \frac{e^{-\frac{i\omega\delta t}{2}}}{\sqrt{\pi}x_0} e^{-\frac{1}{2}\left(\frac{x''^2}{x_0^2} + \frac{x'^2}{x_0^2}\right)} \sum \frac{e^{-i\omega\delta tn}}{2^n n!} H_n(\frac{x''}{x_0}) H_n(\frac{x'}{x_0}).$$
(16)

Now, considering that, for $\zeta=e^{-i\omega\delta t}$, $\xi=\frac{x''}{x_0}$ and $\eta=\frac{x'}{x_0}$

$$e^{-(\xi^2 + \eta^2)} \sum \frac{\zeta^n}{2^n n!} H_n \xi H_n \eta = \frac{e^{-\frac{\xi^2 + \eta^2 - 2\xi \eta \zeta}{1 - \xi^2}}}{\sqrt{i - \zeta^2}},$$
(17)

we have

$$K = \frac{e^{-\frac{i\omega\delta t}{2}}}{\sqrt{\pi}x_0}e^{\frac{1}{2}(\xi^2+\eta^2)}\frac{e^{-\frac{\xi^2+\eta^2-2\xi\eta\zeta}{1-\zeta^2}}}{\sqrt{i-\zeta^2}} = \frac{e^{\left(-\frac{(\xi^2+\eta^2)e^{i\omega\delta t}-2\xi\eta}{e^{i\omega\delta t}-e^{-i\omega\delta t}}+\frac{\xi^2+\eta^2}{2}\right)}}{x_0\sqrt{2\pi i\sin(\omega\delta t)}} = \sqrt{\frac{m\omega}{2\pi i\hbar\sin(\omega\delta t)}}e^{-\frac{(\xi^2+\eta^2)(\cos(\omega\delta t)+i\sin(\omega\delta t))-2\xi\eta-is(\xi^2+\eta^2)}{2i\sin(\omega\delta t)}}$$

$$\tag{18}$$
